Federal Communications Commission Part 68

This equipment complies with Part 68 of the FCC rules and the requirements adopted by the ACTA. On the back of the TE 200 Series printed circuit board is a label that contains, among other information, a product identifier in the format US:AAAEQ##TXXXX. If requested, this number must be provided to the telephone company.

A plug and jack used to connect this equipment to the premises wiring and telephone network must comply with the applicable FCC Part 68 rules and requirements adopted by the ACTA.

If the TE 200 Series causes harm to the telephone network, the telephone company may notify you in advance that temporary discontinuance of service may be required. But if advance notice is not practical, the telephone company will notify you as soon as possible. Also, you will be advised of your right to file a complaint with the FCC if you believe it is necessary.

The telephone company may make changes in its facilities, equipment, operations or procedures that could affect the operation of the equipment. If this happens, the telephone company will provide advance notice in order for you to make necessary modifications to maintain uninterrupted service.

If you experience problems with the TE 200 Series, contact Digium, Inc. (+1.256.428.6161) for repair and/or warranty information. If the equipment is causing harm to the telephone network, the telephone

company may request that you disconnect the equipment until the problem is resolved.

FCC Part 15

This device complies with part 15 of FCC rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) This device must accept any interference received, including interference that may cause undesired operation.

Industry Canada Compliance Information

Notice: The Industry Canada label applied to the product (identified by the Industry Canada logo or the "IC:" in front of the certification/registration number) indicates that the Industry Canada technical specifications were met.

Introduction to TE 200 Series Documentation

This manual is a user guide for Digium's TE 200 Series cards. The Digium TE 200 Series cards are a T1/E1 capable card series created for voice and data. The cards in this series are as follows:

Table 1: TE200 Series Cards

Model	Features	Type
TE220B	3.3 volt, 2 Ports, Echo Cancellation	PCI Express
TE220	3.3 volt, 2 Ports	PCI Express
TE212P	3.3 volt, 2 Ports, Echo Cancellation	PCI 2.2
TE210P	3.3 volt, 2 Ports	PCI 2.2
TE207P	5.0 volt, 2 Ports, Echo Cancellation	PCI 2.2
TE205P	5.0 volt, 2 Ports	PCI 2.2

Document Organization

The manual is organized in the following manner:

Chapter/ Appendix	Title	Description
1	Overview	Identifies the features of the card you received. This chapter covers applications and uses of the TE 200 Series cards in the real world.
2	Card Installation	Provides instructions for installing the card in your PC, acquiring correct drivers, and checking device compatibility.
3	Configuration	Provides examples for configuring dial plan options.
4	Troubleshooting	Explains resolutions to common problems and frequently asked questions pertaining to card installation and usage.
A	Pin Assignments	Lists the connectors and pin assignments.
B	Specifications	Details card specifications.
C	Glossary and Acronyms	Defines terms related to this product.

Symbol Definitions

Caution statements indicate a condition where damage to the unit or its configuration could occur if operational procedures are not followed. To reduce the risk of damage or injury, follow all steps or procedures as instructed.

The ESD symbol indicates electrostatic sensitive devices. Observe precautions for handling devices. Wear a properly grounded electrostatic discharge (ESD) wrist strap while handling the device.

The Electrical Hazard Symbol indicates a possibility of electrical shock when operating this unit in certain situations. To reduce the risk of damage or injury, follow all steps or procedures as instructed.

Important Safety Instructions

User Cautions

Servicing.

Do not attempt to service this card unless specifically instructed to do so. Do not attempt to remove the card from your equipment while power is present. Refer servicing to qualified service personnel.

Water and Moisture.

Do not spill liquids on this unit. Do not operate this equipment in a wet environment.

Heat.

Do not operate or store this product near heat sources such as radiators, air ducts, areas subject to direct, intense sunlight, or other products that produce heat.

Static Electricity.

To reduce the risk of damaging the unit or your equipment, do not attempt to open the enclosure or gain access to areas where you are not instructed to do so. Refer servicing to qualified service personnel.

Save these instructions for future reference.

Chapter 1

Overview

The Digium TE 200 Series cards are a T1/E1 capable card series created for voice and data. They support industry standard protocols, including Robbed Bit Signaling, E&M, Primary Rate ISDN (PRI), and several data modes (PPP, HDLC, Cisco HDLC and frame relay). The TE200 Series are capable of running in E1, T1, or J1 modes. They are also capable of DACSing channels from one span to another. The TE 200 Series are ideal for connecting phones to a channel bank, connecting to your T1/E1 switch, or connecting to a legacy PBX.

This manual is for use with the TE220/TE220B PCI Express card, as well as the 5 volt TE205P/207P and the 3.3 volt TE210P/212P Dual T1/E1 PCI cards. These cards are identified collectively as the TE 200 Series cards throughout this manual.

Designed to be fully compatible with existing software applications and integrate fully with Asterisk Open Source PBX/IVR platform, the TE 200 Series cards allow many advanced call features.

Data Modes:

- Cisco HDLC
- HDLC
- PPP
- Multilink PPP
- Frame Relay

Voice Modes:

- PRI CPE and PRI NET
 - NI1
 - NI2
 - EuroISDN
 - 4ESS (AT&T)
 - 5ESS (Lucent)
 - DMS100

- E&M
 - Wink
 - Feature Group B
 - Feature Group D

- FXO and FXS
 - Ground Start
 - Loop Start
 - Loop Start with Disconnect Detect

The TE 200 Series cards can be used to connect your Asterisk machine to the PSTN world, your channel bank, or even another PBX. This is accomplished via a T1/E1 interface. The cards allow Asterisk software to connect to your network, creating a professional telephony environment. Figure 2 shows an example of the card's primary application.

Figure 1: Sample Legacy Phone Application

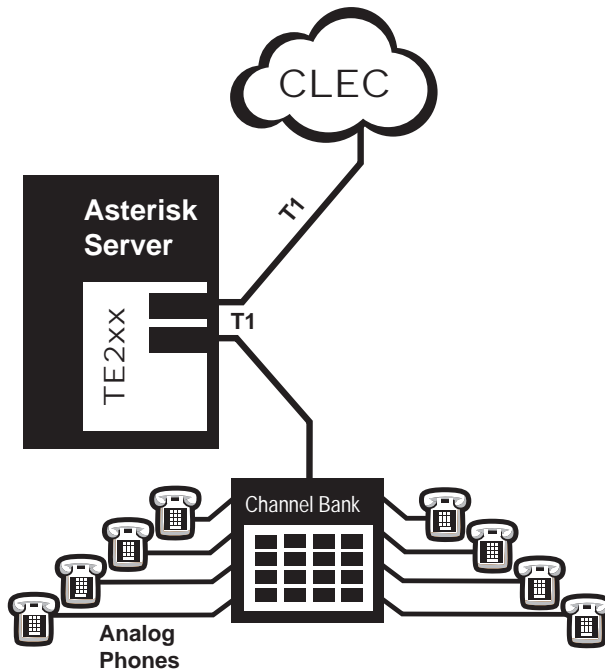

Figure 2: Sample Channel Bank Application

Figure 3: Sample IP Phone Application

What is Asterisk?

Asterisk is the first open-source telephony platform. Since it runs on Linux, it inherits all of the power and stability of that operating system. The name Asterisk is derived from the all-inclusive “wildcard” symbol in UNIX. It is representative of the wide range of opportunities it opens for developers worldwide to create solutions which would otherwise be cost-prohibitive.

Asterisk allows you to create a PBX solution that rivals the features and functionality of traditional telephony switches. Current PBX solutions are expensive and proprietary. International companies are discovering that Asterisk is cost effective, low maintenance, and flexible enough to handle all of their voice and data networking. Using the Asterisk Appliance, anyone can replace an existing small business PBX. You can also utilize the appliance as an adjunct application server for conferencing, voice mail, or IVR. Asterisk will work with most standards-based IP telephone handsets and software. Analog phones and ADSI-screen phones are also supported.

Chapter 2

Card Installation

This chapter provides the following information:

- **Unpacking the Card** on page 21
- **Identifying Communication Ports** on page 22
- **T1/E1 Selection** on page 24
- **Identifying Multiple Cards** on page 24
- **Connecting Timing Cables** on page 25
- **PCI Slot Compatibility** on page 27
- **Hardware Installation** on page 29
- **Software Installation** on page 30

Note: The TE200 Series card installation instructions are written so that they will apply to any card in the series. Examples and card specific information are included as needed.

Unpacking the Card

When you unpack your card, carefully inspect it for any damage that may have occurred in shipment. If damage is suspected, file a claim with the carrier and contact your reseller from which the card was purchased, or Digium Technical Support (+1.256.428.6161). Keep the original shipping container to use for future shipment or proof of damage during shipment.

Note: Only qualified service personnel should install the card. Users should not attempt to perform this function themselves.

Shipment Inspection

The following items are included in shipment of the TE200 Series:

- TE200 Series card (TE205P/207P/210P/212P/220/220B)

Identifying Communication Ports

The TE200 Series cards consist of two RJ45 ports and two status LEDs. The ports are used for connecting T1, E1, or J1 cables. Refer to Figure 4 on page 22 or Figure 5 on page 23 to locate the ports and LEDs.

Figure 4: TE205P Card

Figure 5: TE220 Card

T1/E1 Selection

The card includes a row of jumpers to select either T1 or E1 mode for the spans. An example of the jumpers from the TE 205 card is shown in Figure 6. The T1/E1 mode, in most cases, is set at the distributor before shipment. You may want to check the setting to be certain they are set for your specific use.

Figure 6: T1/E1 Jumpers

Identifying Multiple Cards

If multiple TE200 Series cards are installed in the same machine, then the **Ident** wheel can be used to control the order the cards are recognized. The click wheel switch with the word **Ident** printed above it can be set to a different number for each installed card. This number adjusts the order in which the driver recognizes the card. For example: set the first card **Ident** wheel to 0, set the second card **Ident** wheel to 1, and so on. The **Ident** wheel is shown in Figure 7.

Figure 7: Ident Wheel

Connecting Timing Cables

The timing port allows up to four TE220 cards to share the same sync (timing) source from the T1 line provider, or provide a consistent sync source across multiple cards. This is a useful feature for data and fax modes and some voice applications to prevent corruption due to timing slips on the second, third or fourth TE220 PC cards.

To utilize this feature, daisy-chain the P1 connector between each TE220 card using the Digium 4-position timing cable. See Figure 8 on page 26 for an example. Enable this feature in the drivers using the **timingcable=1** switch when the drivers are loaded:

```
# modprobe wcte2xxp timingcable=1
```

Figure 8: Timing Ports Example

Caution.

Only qualified service personnel should continue with hardware installation and configuration of the TE200 Series card. Users should not attempt to perform these functions themselves.

PCI Slot Compatibility

Check the type of card you received to be sure it is compatible with your PCI slot. To determine which slot you have, identify it by comparing it to those shown in Figure 9 on page 27.

Slot Number:

- 0: AGP Pro Slot
- 1: 64-bit 5.0 volt PCI Slot
- 2: 64-bit 3.3 volt PCI Slot
- 3: 32-bit 5.0 volt PCI Slot
- 4: PCI Express X1 Slot

Figure 9: Motherboard PCI Slots

The TE205P/207P card is a 32-bit 33MHz card keyed for 5.0 volt operation and works in any PCI 2.2 (or higher) compliant slot. This means that in the motherboard shown in Figure 9, the TE205P/207P card will fit into Slots 1 and 3. The TE205P/207P **will not** fit into Slot 2.

The TE210P/212P card is a 32-bit 33MHz card keyed for 3.3 volt operation and works in any PCI 2.2 (or higher) compliant slot. This means that in the motherboard shown in Figure 9, the TE210P/212P card will only fit into Slot 2. The TE210P/212P **will not** fit into Slots 1 or 3.

The TE220/TE220B card is a PCI Express card. Slot 4, illustrated above, is a 1 lane (X1) PCI Express compliant slot. The TE220/TE220B will work in any PCI Express compliant slot, including lane lengths X4, X8, and X16. This means that in the motherboard shown in Figure 9, the TE220 will only fit into Slot 4. The TE220/TE220B **can not** be used in Slots 1 through 3.

Hardware Installation

1. Now that you are acquainted with the cards, power down your computer and unplug it from its power source.
2. Attach a static strap to your wrist and open the case.
3. Check the jumper setting to ensure it matches your equipment configuration. Setting the jumper with the jumper strap **on** enables the ports for E1. Setting the jumper with the jumper strap **off** enables the ports for T1.
4. Remove the bracket place holder and insert the card into the PCI or PCI Express slot. See Figure 10 for an example of card installation.

Figure 10: Insert the Card

5. Replace the cover to your computer.
6. Plug all T1 or E1 equipment cables into the RJ45 ports as needed.

Note: It is recommended that you use shielded cables.

**Caution.**

This unit must be connected to the Telecommunications Network in your country using an approved line cord, e.g.: for Australia use only line cords complying with ACA Technical Standard TS008.

**Caution.**

This unit must be connected only to the appropriate Telecommunications Network port (as approved for use in your specific country).

Software Installation

The card is only supported under Linux. Digium, Inc. recommends Debian, Fedora, and Red Hat, however, all other distributions are supported by Digium Technical Support. Digium hardware requires drivers and libraries that are integrated with the Linux kernel. You can obtain the source code from <ftp.digium.com>. Detailed instructions are provided in this section.

To install software for your TE200 Series card, you will need:

- Full Linux kernel 2.6 (or later) source code.
- Development libraries and headers for libncurses (only necessary for Asterisk).
- Development libraries and headers for zlib and openssl.
- If you are using the 1.2.x series of Asterisk and Zaptel, you will need Asterisk 1.2.18 or newer, and Zaptel 1.2.18 or newer. If you are using the 1.4.x series of Asterisk and Zaptel, you will need Asterisk 1.4.4 or newer and Zaptel 1.4.3 or newer. If you are using Asterisk Business Edition, you will need version B.2 or newer.

1. Check your **lspci** PCI device listing. Boot the computer into Linux. After the machine has loaded, log in and execute the following:
lspci -n

Confirm your **lspci** PCI device listing by scanning for the following information in the output screen:

```
0000:01:0e.0 ISDN controller: Unknown device
d161:<card identifier>
```

In the device listing shown above, <card identifier> will be populated with one of the identifiers listed in the table below.

Table 1: Card Identifiers

Model	Identifier
TE220B	0220
TE220	0220
TE212P	0210
TE210P	0210
TE207P	0205
TE205P	0205

A Digium TE200 Series (TE220B/TE220/212P/210P/207P/205P) ISDN Controller should be identified. If a controller is not identified, then your machine is not PCI 2.2 (or higher) or PCI Express compatible and the card will not work with your equipment.

2. Download the latest Zaptel drivers (1.2.17 or later). The Zaptel drivers can be downloaded using either ftp or http.
They are accessible via ftp from <ftp://ftp.digium.com/pub/zaptel>.
They are accessible via http from <http://ftp.digium.com/pub/zaptel/>.

3. Expand the downloaded tarballs:

```
#tar -zxvf zaptel-1.X.X.tar.gz
#cd zaptel-1.X.X
#make
#make install
```

Note: If you don't already have configuration files installed, you can type `make samples` to install the default sample configuration files.

4. Download the latest released version of Asterisk (1.2.18 or later).
Asterisk can be downloaded using ftp or http.
It is accessible via ftp from <ftp://ftp.digium.com/pub/asterisk>.
It is also accessible via http from <http://ftp.digium.com/pub/asterisk>.

5. Expand the downloaded tarballs. Substitute the version of Asterisk you are using with the XX in the command lines below.

```
# tar -zxvf asterisk-1.2.xx.tar.gz
# cd asterisk-1.2.xx/
# make
# make install
```

If the build fails, it may be because you are missing one of the build dependencies, the kernel source, or development tools. Feel free to contact your reseller where the card was purchased, or call Digium Technical Support (+1.256.428.6161) for assistance.

Note: Complete instructions for installing Asterisk are available at www.asterisk.org.

Chapter 3

Configuration

The TE200 Series cards have a variety of configuration options. This chapter provides configurations for PRI, channel bank, E&M wink, and finally, data mode. These sample configurations are provided to assist you in familiarizing yourself with the flexibility of editing the configuration files to meet your specific needs. The list of possible configurations is too expansive to cover in this user manual.

Configuring T1/E1 Lines

1. Begin by opening the **zaptel.conf** file from the **/etc/asterisk/** directory.
2. Configure the SPAN Map.

For each T1/E1 you are using you will need to define a span. The SPAN map includes defining the SPAN number, timing, line build out, framing and coding. Configuration details for each of these items is explained in this section.

span => NUMBER, TIMING, LINE BUILD OUT, FRAMING, CODING

Number:

This is the port the span is plugged into. Port 1 being the furthest span from the PCI bus. The port numbers are noted on the PCI bracket.

Timing:

Determines whether the card provides timing (0), takes timing (1), takes backup span timing (2), provides backup span timing (3), and so on. Only one span can be defined to take timing and it defines timing for the rest of the card spans.

Line Build Out

For most setups the line build out is 0.

0: 0 db (CSU) / 0-133 feet (DSX-1)

1: 133-266 feet (DSX-1)

2: 266-399 feet (DSX-1)

3: 399-533 feet (DSX-1)

4: 533-655 feet (DSX-1)

5: -7.5db (CSU)

6: -15db (CSU)

7: -22.5db (CSU)

Framing

T1 utilizes framing set for D4 (SF) or ESF. E1 utilizes CAS or CCS.

Coding

T1 coding can be AMI or B8ZS. E1 coding can be AMI or HDB3. E1 can also have the extra flag CRC4 at the end for CRC4 checking. Yellow flag can also be added at the end for transmitting a yellow alarm when all channels are in use.

The following is a typical setup for a telco in the US:

```
span => 1,1,0,esf,b8zs
```

In Europe:

```
span=>1,1,0,ccs,hdb3
```

First Example: Channel Bank

The Channel Bank in this example has 24 FXS ports. In this configuration, the **zaptel.conf** is set for the card to provide timing to the channel bank and **fxoks** is set for 24 stations.

Set **zapata.conf** to mirror the configuration with **signalling=fxo_ks** and define it for channels 1-24.

```
/etc/zaptel.conf:  
span=1,0,0,esf,b8zs  
fxoks=1-24
```

```
/etc/asterisk/zapata.conf:  
group=1  
context=channelbank  
signalling=fxo_ks  
channel=1-24
```

Second Example: E&M Line

In the E&M Line configuration, the **zaptel.conf** is set for the card to take timing from the telco on E&M with wink while **zapata.conf** mirrors the configuration. However, Feat_D is a type of E&M with wink that accepts DID, but there are many E&M options; E&M_W, E&M, Feat_B, etc.

```
/etc/zaptel.conf:
span=1,1,o,esf,b8zs
e&m=1-24
/etc/asterisk/zapata.conf:
group=1
context=incoming
signalling=feat_d
channel=1-24
```

Third Example: PRI

By setting the card to take timing in **zaptel.conf**, you acquire 23 b channels and voice channels, with channel 24 as the data transport. For Asterisk, define PRI_CPE so it is the client side. Define the switch type you are connecting to as **national**. There are several options for the switch type including 5ESS, 4ESS, and NI1. You will then have 23 voice channels for Asterisk.

PRI T1

```
/etc/zaptel.conf:  
span=1,1,0,esf,b8zs  
bchan=1-23  
dchan=24
```

```
/etc/asterisk/zapata.conf  
group=1  
signalling=pri_cpe  
switchtype=national  
context=incoming  
channel=1-23
```

PRI E1

```
/etc/zaptel.conf:  
span=1,1,0,ccs,hdb  
bchan=1-15,17-31  
dchan=16
```

```
/etc/asterisk/zapata.conf  
group=1  
signalling=pri_cpe  
switchtype=euroisdn  
context=incoming  
channel=1-15,17-31
```

Fourth Example: Data Mode

Data mode is a little different than the other options. The **zaptel.conf** is configured as follows:

```
/etc/zaptel.conf
span=1,0,0,esf,b8zs
nethdlc=1-24
```

1. Instructions for Cisco HDLC:

Compile kernel with HDLC support:

Note: We suggest that you use either a Kernel version of 2.4.20 or less, or a Kernel of 2.6.8 or greater. The HDLC implementation in the interval kernels is in a state of too much flux. The following data modes are described in this section:

- WAN Interfaces Support
- Generic HDLC Layer
- Cisco HDLC support

2. Rebuild and reboot into your kernel.

3. Uncomment the following line in **zconfig.h** of the Zaptel package:

```
#define CONFIG_ZAPATA_NET
```

If you are using a kernel prior to 2.4.19, also uncomment this line:

```
#define CONFIG_OLD_HDLC_API
```

Rebuild Zaptel including the creation of the **SetHDLC** utility:

```
make sethdlc-new;use "make sethdlc" for  
;kernels 2.4.19 and prior  
make install
```

4. Load and configure your driver:

```
modprobe wcte2xxp  
ztcfg
```

5. Use **sethdlc** to bring up the interface:

```
sethdlc hdlc0 cisco
```

-or- for old style (make **sethdlc** instead of **sethdlc-new**) use:

```
sethdlc hdlc0 mode cisco
```

6. Assign the interface an address:

```
ifconfig hdlc0 192.168.0.1 netmask 255.255.255.0
```

7. The interface may be addressed as any other networking interface (i.e., eth0) in Linux.

Testing Your configuration.

1. Load Zaptel drivers into the kernel using the program **modprobe**. The appropriate driver for the TE200 Series cards is **wcte2xxp**. Users in all countries except Australia should use the following modprobe command:

```
# modprobe wcte2xxp
ztcfg -vv
dmesg screen import
```

Note: Output may vary depending on the TE200 Series card you use.

2. Run **zttool** from the command line and see if the span turns green for each span you have connected.

```
zttool
```

3. Execute the following Asterisk command to see if the span came up successfully.

```
asterisk
asterisk -vvvr
```

Chapter 4

Troubleshooting

This chapter provides frequently asked questions as identified from Digium Technical Support and possible resolutions. Multiple resources are available to obtain more information about Asterisk and Digium products. These resources are listed on page 46.

What do the LED colors indicate?

- Green - Card is in-sync with the far end.
- Yellow - Card is synchronizing.
- Red - Card is not seeing far end, circuit is not up, or cable is bad.

How do I identify which card I have using software?

Check your **lspci** PCI device listing. Boot the computer into Linux. After the machine has loaded, log in and execute the following:

```
# lspci -n
```

Confirm your **lspci** PCI device listing by scanning for the following information in the output screen:

```
0000:01:0e.0 ISDN controller: Unknown device
d161:<card identifier>
```

In the device listing shown above, <card identifier> will be populated with one of the identifiers listed in the table below.

Table 2: Card Identifiers

Model	Identifier
TE220B	0220
TE220	0220
TE212P	0210
TE210P	0210
TE207P	0205
TE205P	0205

A Digium TE200 Series (TE220B/TE220/212P/210P/207P/205P) ISDN Controller should be identified. If a controller is not identified, then your machine is not PCI 2.2 (or higher) or PCI Express compatible and the card is not working with your equipment.

I can't receive DID calls even though I have it enabled in extensions.conf.

Your telco might be sending calls with a method you are not expecting.

1. Check the method being used by attempting the following in your line context:

```
_x.,1,noop(My DID Matches as ${EXTEN})
```

2. Then type **reload** in the Asterisk console and call in. You should see the DID come in on your T1/E1 line.

My D Channel seems to go up and down.

Check to be sure you have set your timing parameters correctly. Also check the common causes of problems for a T1. See the **Common Fixes for all cards**, page 45.

I have trouble dialing out. It seems that one type of dialing works (local, long distance, international) but another does not.

Check your **pridialplan** variable and be sure that you are dialing using the method your telco is expecting.

I am having trouble receiving DID information over E&M.

Try the other types of E&M (featd, featb, etc.) to match the method your telco is using to stream information.

I am having issues with my PRI. How can I see the messages coming across my D channel?

Enter the following command:

```
PRI debug span X
```

where x is the port from which you are connected. This command will show you the PRI messages coming across your D channel for that message.

I am still having problems and the telco tells me it is my equipment.

The first thing to do in this situation is to test your equipment.

1. Plug in a loopback cable. (A loopback cable is a cable that has pin 1 going to pin 4 and pin 2 going to pin 5.) Plug the cable into the span and wait for its LED to turn green.
2. Stop Asterisk and edit **zaptel.conf** by removing the lines defined for your card and replacing them with the following:

```
span=>1,0,0,esf,b8zs  
clear=1-24
```

Or if you have an E1 span:

```
span=> 1,0,0,ccs,hdb3  
clear=1-31
```

3. Navigate to your zaptel source directory and type:
make tests

Followed by:

```
./patlooptest /dev/zap/1 60
```

The first argument in the patlooptest command is the device for the channel number you want to test. You should always test the first channel of a span. The second argument is the duration in seconds to run the test.

This runs a pattern looptest for 60 seconds. If you receive any failures, it is possible you have a bad card and will need to call Digium Technical Support (+1.256.428.6161)

Common Fixes for all cards

1. Check to see if X windows is running by entering the following:

```
ps aux|grep X
```

If X windows is running, stop the application since it may cause a conflict with Asterisk.

2. Check to see if your hard drives are running with DMA levels set. Perform an **hdparm** on your hard drive interface.

If you are still having problems contact your reseller where the card was purchased, or Digium Technical Support (+1.256.428.6161).

How can I enable more features?

To view all of the options available to add to your dial plan, type the following command from within Asterisk:

```
show applications
```

Digium also offers services to help configure and add features you might need. Contact Digium Technical Support (+1.256.428.6161) for more information.

Where can I find answers to additional questions?

There are several places to inquire for more information about Asterisk Digium products:

1. Digium Technical Support (+1.256.428.6161), or Toll Free in the U.S. (1.877.546.8963), is available 7am-7pm Central Time (GMT -6), Monday - Friday.
2. Asterisk users mailing list (asterisk.org/lists.digium.com).
3. IRC channel **#asterisk** on (irc.freenode.net).

Maintenance Support Program

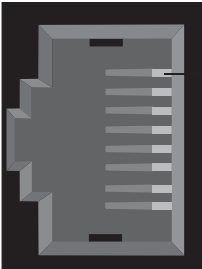

Digium is dedicated to supporting your Asterisk system by offering full technical support through our Maintenance Support Program. The Maintenance Support Program covers all Digium hardware and the complete Asterisk software suite. Through this program, you can be at ease knowing that your business will always have access to the Asterisk experts. To obtain a quote for maintenance please contact Asterisk Express sales at +1.256.428.6060 or express@digium.com.

Appendix A

Pin Assignments

Both ports on the TE200 Series card bracket are 8-pin RJ45 ports. The pin assignments are identified in Table A-1.

Table A-1: RJ45 Telco Port Connector

	Pin	Description
	1	Rx
	2	Rx
	3	Not used
	4	Tx
	5	Tx
	6	Not used
	7	Not used
	8	Not used

Appendix B

Specifications

This appendix provides specifications, required environmental conditions, and maximum power consumption for the Asterisk Appliance card.

Physical (All Cards).

Size: 5" × 3.75" × 0.63" (12.7 x 9.53 x 1.6 cm)

PCB size, does not include the PCI bracket

Weight: 3.5 oz (100gm) - Without Echo Cancellation Module

Interfaces.

Local Loop Access: E1, T1, J1, PRI; RJ45

(TE205P/207P/212P/210P) - PCI Bus: 3.3V or 5V bus slot, half-length slot minimum size, 33MHz minimum bus speed, compliant with PCI 2.2 or greater.

(TE220) - PCI-E X1, compliant with PCI-E X1 1.0 or greater.

Environment.

Temperature: 0 to 50° C (32 to 122° F) operation

-20 to 65° C (4 to 149° F) storage

Humidity: 10 to 90% non-condensing

Hardware and Software Requirements.

800-Mhz Pentium III or better

64MB RAM

Available PCI (TE205P/207P/210P/212P) or PCI-E (TE220) Slot

Table B-2: Maximum Power Consumption

Model	Power
TE220B 3.3V	4.0 Watts
TE220 3.3V	2.0 Watts
TE212P 3.3V 5V	2.5 Watts 0.5 Watts
TE210P 3.3V 5V	1.5 Watts 0 Watts
TE207P 3.3V 5V	2.5 Watts 0.5 Watts
TE205P 3.3V 5V	1.5 Watts 0 Watts

Appendix C

Glossary and Acronyms

ANSI *American National Standards Institute*

An organization which proposes and establishes standards for international communications.

asynchronous

Not synchronized; not timed to an outside clock source. Transmission is controlled by start bits at the beginning and stop bits at the end of each character. Asynchronous communications are often found in internet access and remote office applications.

attenuation

The dissipation of a transmitted signal's power as it travels over a wire.

bandwidth

The capacity to carry traffic. Higher bandwidth indicates the ability to transfer more data in a given time period.

bit

The smallest element of information in a digital system. A bit can be either a zero or a one.

bps *bits per second*

A measurement of transmission speed across a data connection.

broadband

Broadband transmission shares the bandwidth of a particular medium (copper or fiber optic) to integrate multiple signals. The channels take up different frequencies on the cable, integrating voice, data, and video over one line.

channel

A generic term for an individual data stream. Service providers can use multiplexing techniques to transmit multiple channels over a common medium.

Cat5

Category of Performance for wiring and cabling. Cat 5 cabling support applications up to 100 MHz.

Cat5E

Category of Performance for wiring and cabling. Category 5 Enhanced wiring supports signal rates up to 100 MHz but adheres to stricter quality specifications.

CLEC *competitive local exchange carrier*

A term for telephone companies established after the Telecommunications Act of 1996 deregulated the LECs. CLECs compete with ILECs to offer local service. See also *LEC* and *ILEC*.

CO *central office*

The CO houses local switching equipment. All local access lines in a particular geographic area terminate at this facility (which is usually owned and operated by an ILEC).

CPE *customer premises equipment*

Terminal equipment which is connected to the telecommunications network and which resides within the home or office of the customer. This includes telephones, modems, terminals, routers, and television set-top boxes.

DS0 *Digital Signal, Level 0*

A voice grade channel of 64 Kbps. The worldwide standard speed for digitizing voice conversation using PCM (Pulse Code Modulation).

DS1 *Digital Signal, Level 1*

1.544 Mbps in North America (T1) and Japan (J1) -up to 24 voice channels (DS0s), 2.048 Mbps in Europe (E1) - up to 32 voice channels (DS0s). DS1/T1/E1 lines are part of the PSTN.

DS3 *Digital Signal, Level 3*

T3 in North America and Japan, E3 in Europe. Up to 672 voice channels (DS0s). DS3/T3/E3 lines are not part of the PSTN

DTMF *Dual Tone Multi-Frequency*

Push-button or touch tone dialing.

E1

The European equivalent of North American T1, transmits data at 2.048 Mbps, up to 32 voice channels (DS0s).

E3

The European equivalent of North American T3, transmits data at 34.368 Mbps, up to 512 voice channels (DS0s). Equivalent to 16 E1 lines.

EMI *Electromagnetic Interference*

Unwanted electrical noise present on a power line

full duplex

Data transmission in two directions simultaneously.

FXO *Foreign Exchange Office*

Receives the ringing voltage from an FXS device.

FXS *Foreign Exchange Station*

Initiates and sends ringing voltage.

G.711

The International Telecommunications Union recommendation for an algorithm designed to transmit and receive mulaw PCM voice and A-law at digital bit rate 64 Kbps. This algorithm is used for digital telephone sets on digital PBX.

G.729

An International Telecommunications Union standard for voice algorithm.

H.323

An International Telecommunications Union standard for multimedia communications over packet-based networks.

IAX *Inter-Asterisk eXchange*

A VoIP protocol used by Asterisk. It is used to enable VoIP connections between Asterisk servers, and between servers and clients that also use the IAX protocol.

iLBC *internet Low Bitrate Codec*

A free speech codec used for voice over IP. It is designed for narrow band speech with a payload bitrate of 13.33 kbps (frame length = 30ms) and 15.2 kbps (frame length = 20 ms).

ILEC *incumbent local exchange carrier*

The LECs that were the original carriers in the market prior to the entry of competition and therefore have the dominant position in the market.

interface

A point of contact between two systems, networks, or devices.

ISO *International Standards Organization*

LED *light-emitting diode*

Linux

A robust, feature-packed open source operating system based on Unix that remains freely available on the internet. It boasts dependability and offers a wide range of compatibility with hardware and software. Asterisk is supported exclusively on Linux.

loopback

A state in which the transmit signal is reversed back as the receive signal, typically by a far end network element.

MGCP *Media Gateway Control Protocol*

multiplexing

Transmitting multiple signals over a single line or channel. FDM (frequency division multiplexing) and TDM (time division multiplexing) are the two most common methods. FDM separates signals by dividing the data onto different carrier frequencies, and TDM separates signals by interleaving bits one after the other.

MUX *multiplexer*

A device which transmits multiple signals over a single communications line or channel. See multiplexing.

PBX *private branch exchange*

A smaller version of a phone company's large central switching office.
Example: Asterisk.

PCI *peripheral component interconnect*

A standard bus used in most computers to connect peripheral devices.

POP *point of presence*

The physical connection point between a network and a telephone network. A POP is usually a network node serving as the equivalent of a CO to a network service provider or an interexchange carrier.

POTS *plain old telephone service*

Standard phone service over the public switched telephone network (PSTN). This service provides analog bandwidth of less than 4 kHz.

PPP *point-to-point protocol*

Type of communications link that connects a single device to another single device, such as a remote terminal to a host computer.

PSTN *public switched telephone network*

A communications network which uses telephones to establish connections between two points. Also referred to as the dial network.

QoS *quality of service*

A measure of telephone service, as specified by the Public Service Commission.

RJ11

A six-pin jack typically used for connecting telephones, modems, and fax machines in residential and business settings to PBX or the local telephone CO.

SIP *Session Initiation Protocol*

An IETF standard for setting up sessions between one or more clients. It is currently the leading signaling protocol for Voice over IP, gradually replacing H.323.

T1

A dedicated digital carrier facility which transmits up to 24 voice channels (DS0s) and transmits data at 1.544 Mbps. Commonly used to carry traffic to and from private business networks and ISPs.

T3

A dedicated digital carrier facility which consists of 28 T1 lines and transmits data at 44.736 Mbps. Equivalent to 672 voice channels (DS0s).

TDM *time division multiplexer*

A device that supports simultaneous transmission of multiple data streams into a single high-speed data stream. TDM separates signals by interleaving bits one after the other.

telco

A generic name which refers to the telephone companies throughout the world, including RBOCs, LECs, and PTTs.

tip and ring

The standard termination on the two conductors of a telephone circuit; named after the physical appearance of the contact areas on the jack plug.

twisted pair

Two copper wires commonly used for telephony and data communications. The wires are wrapped loosely around each other to minimize radio frequency interference or interference from other pairs in the same bundle.

V *volts*

VoIP *Voice over IP*

Technology used for transmitting voice traffic over a data network using the Internet Protocol.

Zaptel (Zap)

Zapata Telephony Project dedicated to implementing a reasonable and affordable Computer Telephony platform into the world marketplace.
